

# Varicose veins? Tired legs?

## Most modern treatment for varicose veins

The varicose veins are permanently closed off by using a micro-foam sclerotherapy. All treatments are performed as out patient service. The therapy is virtually painless, therefore, the patient is able to leave the office upon completion of treatment.

### Extensive advantages to this new method:

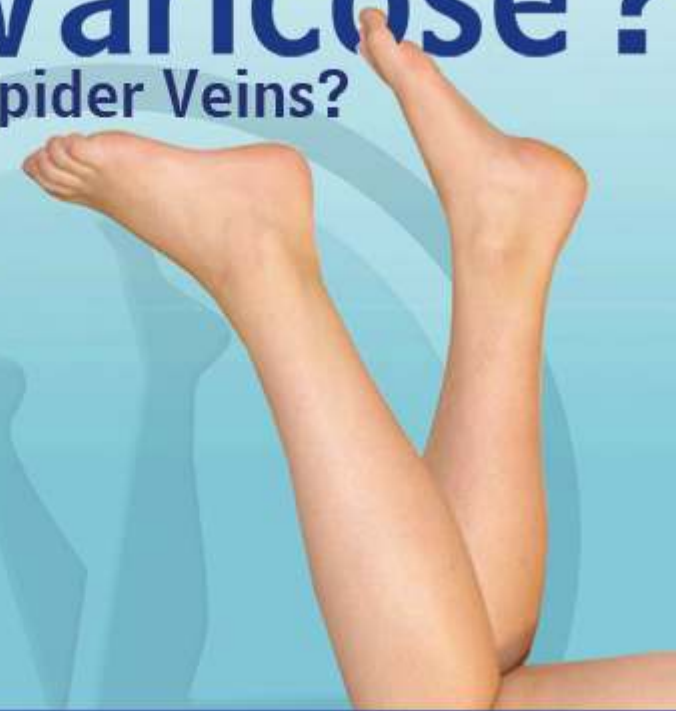

- painless procedure
- virtually painfree post-therapy
- no surgery
- no anesthesia
- no hospitalization
- no scaring
- quick recovery
- superb esthetic results
- possible throughout the whole year
- permanent results
- \*Ultrasound follow-up examination

*„Just as only the tip of the „iceberg“ is visible, so do varicose veins lie „invisible“. That's why we recommend a consultation including a diagnosis of your veinstatus, free of charge.*

*„The earlier I treat my varicose veins, the better results I will have, and my deep veins will remain healthy“.*

invasive vein therapy

#### Do you suffer from heavy swollen legs in the evenings?

This could be the first sign of varicose veins. Varicose veins should be taken seriously, even when there are no primary complaints. Larger, diseased varicose veins, commonly lie hidden beneath small superficial varicose veins which can lead to complications. Come and receive a professional consultation which could make a difference for your health.

#### For whom is this method of treatment suited?

This method is suited for everyone, of all ages, and is especially ideal for vein diseases in early stages, recurrences, as well as complex cases.

#### How is the treatment carried out?

The first consultation will determine the most appropriate method for your needs by careful examination with a high resolution ultrasound device. This will determine the degree of varicose as well as any deep vein pathology.

After localizing the varicose vein sonographically, a special micro-foam is injected which causes the varicose vein to occlude permanently. These will then be absorbed physiologically over a period of approximately three months.

Upon completion of this innovative procedure, a compression stocking is applied. The patient may return home immediately and is not inhibited from his or her daily routine.

Since varicose veins are hereditary, annual sonographic check ups are highly recommended.

Every second person suffers with spider veins. There is no need to plague yourself with imperfect skin. Of course we perform cosmetic treatments too.

These small branched blood vessels often referred to as 'starbusts' or purple thread-like lines under the skin get their name due their appearance. Spider veins can occur on the face and legs, which are usually harmless and occur suddenly with hormonal changes such as in puberty, during pregnancy or discontinuation of birth control pills. Also, excessive weight, sun, hot baths, crossed-over legs or longer periods of standing can promote spider veins. Treatment is performed with a spot laser or local sclerotherapy because your beauty should not have to suffer.
